

Mass exponent: $\ln \text{Tr } \rho_A^q = -\tau(q) \ln(1/\epsilon)$

Generalised dimensions = Renyi entropies per $\ln(1/\epsilon)$

Singularity spectrum = entanglement-spectrum density
 $f(\alpha_q) = \text{refined Renyi } S_{-q} / \ln(1/\epsilon)$

Wave-function multifractality at the quantum Hall transition
(participation spectrum of $|\psi|^2$, not of ρ_A)
